

DAYS 1-60

Read the system. Choose the proof.

DAYS 1-30 - READ

Map strategy, platforms, standards, governance, active demand, stakeholders, recurring friction, duplicated components, review delays, support burden, and unclear ownership.

- Interview business, scientific, data, cloud, security, privacy, compliance, product, automation and operations stakeholders.
- Establish baseline measures for review cycle time, reuse, reliability, cost visibility, adoption and exception age.
- Deliver an architecture landscape, friction map, stakeholder topology and proof-selection criteria.

DAYS 31-60 - CHOOSE

Select one bounded, decision-critical use case with accountable business and technical owners.

- Create the architecture contract: outcome, data authority, AI role, human authority, controls, integration, operations and reuse criteria.
- Resolve build/buy/reuse/partner decisions and define minimum evidence for promotion.
- Conduct a pre-mortem and risk review before implementation momentum hardens assumptions.

DAY-60 EXIT CRITERIA

- Architecture landscape and friction map are agreed enough to act.
- One bounded use case has accountable business and technical owners.
- The architecture contract and evidence threshold are explicit.
- Known privacy, security, compliance and operating risks are visible before build momentum.

DAYS 61-90

Run one reference pattern.

Work with the squad to translate the contract into components, interfaces, policies, tests and operating responsibilities.

EXECUTION GUIDANCE

- Instrument traces, logs, metrics, evaluation, access evidence, lineage, cost, latency, failure and support signals.
- Define SLOs, incident ownership, escalation, rollback and change controls.
- Record unresolved risks and legitimate exceptions instead of forcing false conformity.

DAY-90 EVIDENCE PACKAGE

Reference architecture | decision records | data and authority map | threat/privacy/compliance review | evaluation plan | observability and cost dashboard | operations runbook | adoption mechanism | disposition recommendation

REVIEW GATES

VALUE Is the workflow outcome still worth the operating burden?	AUTHORITY Are data and human decision rights explicit?
TRUST Do evaluation and controls support the consequence level?	OPERATIONS Are SLOs, support, incident and rollback ownership ready?

DAYS 91-120

Compound the learning.

Convert proof into reference patterns, decision templates, control requirements, evaluation harnesses, integration contracts, IaC guidance, cost models and runbooks.

SYSTEM CHANGES

- Establish a disposition cadence to promote, revise, hold, retire or explicitly exempt patterns based on evidence.
- Clarify decision rights across architecture, platform teams, squads, security, privacy, compliance, data and business leaders.
- Create a prioritized next-wave backlog grounded in enterprise value and observed friction.

BALANCED SCORECARD

- Outcome: workflow result and cycle time
- Reuse: pattern adoption and duplication avoided
- Reliability: SLOs, incidents and recovery
- Trust: grounding, access, privacy and compliance
- Economics: unit cost and realized value
- Adoption: retained use and exception behavior
- Learning: feedback-to-change time

DAY-120 EXIT CRITERIA

- One bounded pattern has a clear evidence-based disposition.
- Architecture friction and decision rights are more legible than on day one.
- Reusable assets exist in the places squads actually work.
- Leadership can see whether architecture is improving speed, trust, reliability, cost and adoption.
- The next-wave backlog is grounded in enterprise value and observed friction.
